

**WHAT IS CLAIMED IS:**

1. A chair improvement structure, comprising  
a stationary support fixed to a top of a main support leg of a chair;
- 5    a movable support fixed to a lower side of a seat, the movable support  
being connected with a front end of the stationary support in up and  
down angularly displaceable manner at a front end thereof; elastic  
elements being connected with both of the supports for propping up a  
rear end of the seat to a higher position, and
- 10    a mechanism for limiting position of the movable support as well as the  
seat; the mechanism having an adjustment rod inserted in slots of the  
movable support as well as holes of the stationary support to be  
operated in angularly displaceable manner by a user; the mechanism  
having a gear arranged between an upward side of the stationary  
15    support and a downward side of the movable support and turnable  
together with the adjustment rod; an elastic plate being secured to the  
upward side of the stationary support to engage the gear to prevent  
accidental rotation of the gear in case the adjustment rod isn't operated;  
the mechanism having a plurality of eccentric cams arranged next to  
20    the gear and turnable together with the adjustment rod; each cam  
being formed with a stopping edge comprised of a plurality stopping  
sections for propping up the movable support as well as the seat when  
one is seated on the chair.
